Cafe Sales

Stoke optimization

Jessie T. / April 2026

Objective

Evaluate **which products sell the most** in what months, with the goal of making more of them in those months to **optimize time in restocking**.

Content

- Context of the data
- Sales distribution
- Insights
- Recommendations

Context of the data

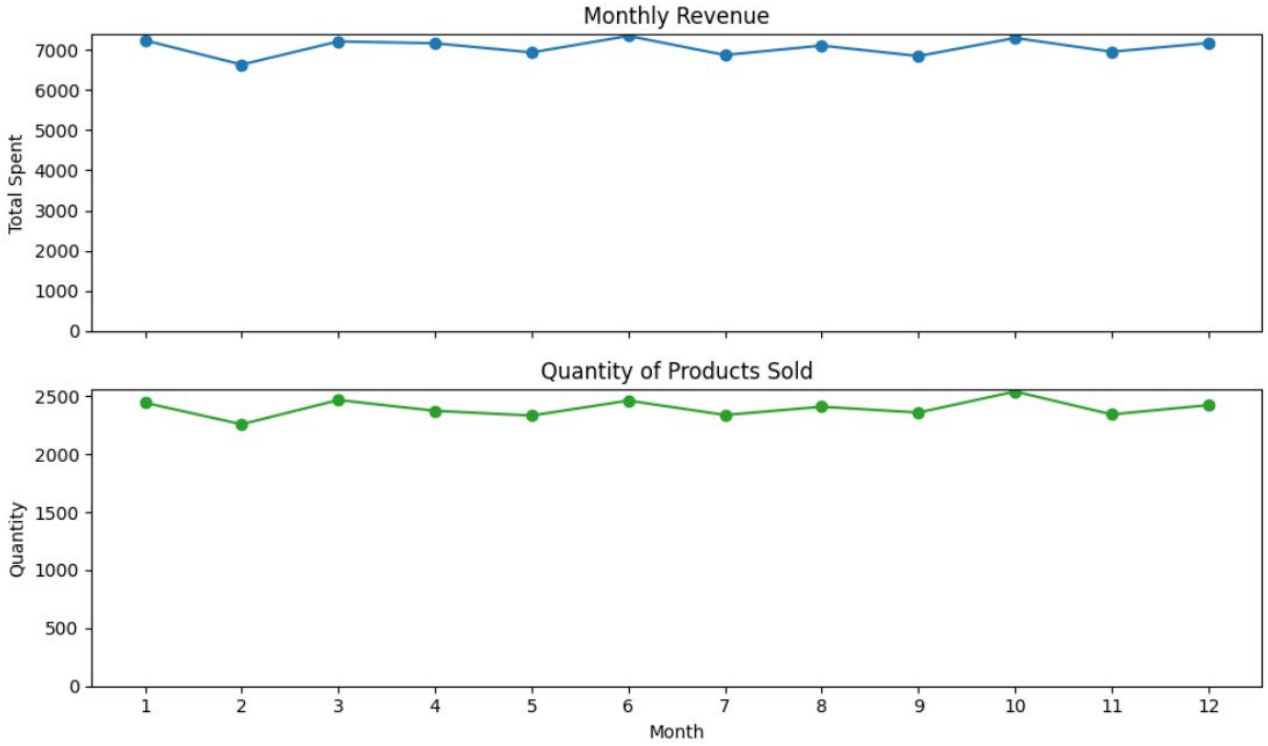
Keypoints

- Origin of the data used (as this is an example it came from Kaggle dataset)
- Out the 10000 rows we used 9540 clean rows

Sales distribution

Keypoints

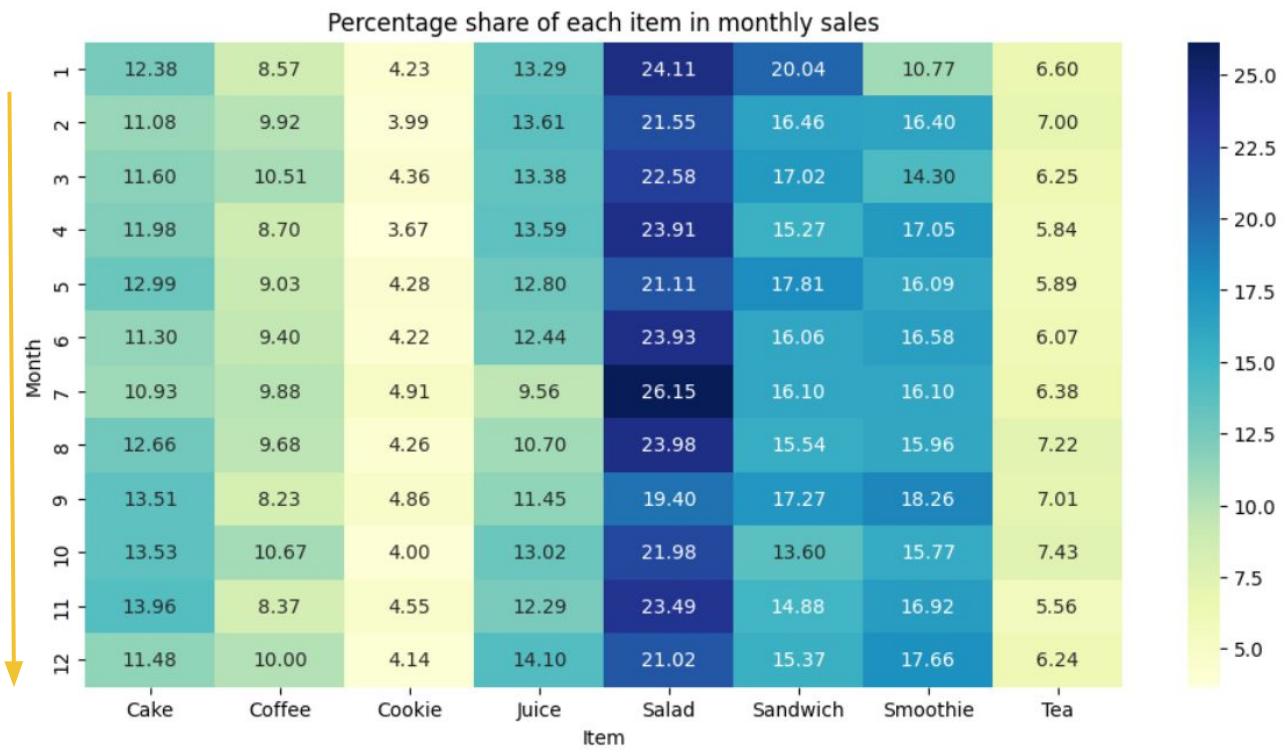
- Consistent demain with minor fluctuations
- Are all products as equally demanded?



Sales distribution: Revenue per month and product

Keypoints

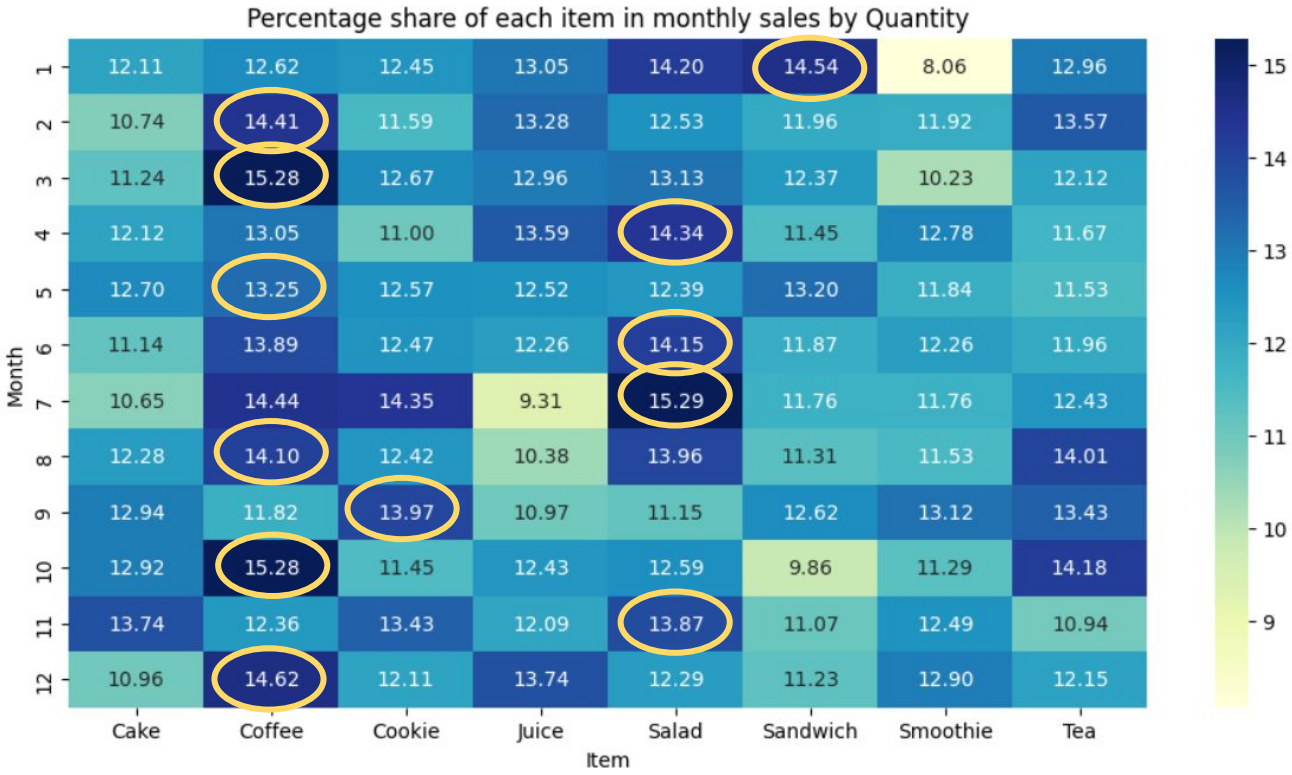
- Most of the sales comes from Salad in every month
- Is it because the salad is more demanded?



Sales distribution: Demand per month and product

Keypoints

- They are almost equally distribute in demand with a small preference each month
- Why didn't the other products with peak demand got more revenue that month?



Insights

- As the products are almost equal in demand the price makes a difference in the revenue.
- Favorite products by month:
  - **January**: Sandwich
  - **February**: Coffee
  - **March**: Coffee
  - **April**: Salad
  - **May**: Coffee
  - **June**: Salad
  - **July**: Salad
  - **August**: Coffee
  - **September**: Cookie
  - **October**: Coffee
  - **November**: Salad
  - **December**: Coffee

Recommendations

- Protect high-revenue products
- Reduce revenue concentration risk
- Leverage high-volume products strategically

Thank you
